

DECLARATION

I, NOBUAKI KATO, a Japanese Patent Attorney registered No. 8517, of Okabe International Patent Office at No. 602, Fuji Bldg., 2-3, Marunouchi 3-chome, Chiyoda-ku, Tokyo, Japan, hereby declare that I have a thorough knowledge of Japanese and English languages, and that the attached pages contain a correct translation into English of the priority documents of Japanese Patent Application No. 2000-358059 filed on November 24, 2000 in the name of CANON KABUSHIKI KAISHA.

I further declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made, are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

Signed this 20th day of December, 2006

NOBUAKI KATO

PATENT OFFICE
JAPANESE GOVERNMENT

This is to certify that the annexed is a true copy
of the following application as filed with this office.

Date of Application: November 24, 2000

[Title of the Invention] Help Server, Helper Terminal
5 Apparatus, Help System, Control Method for Help System
and Storage Medium

[Claim(s)]

[Claim 1] A help server, characterized by:
notice request means for notifying its own
10 communication ability to a user terminal apparatus
which inquires; and

communication ability instruction means for
instructing the helper terminal apparatus, which
responds to the inquiry, to responds to the inquiry in
15 a form suitable for user needs in accordance with the
communication ability notified by said user terminal
apparatus.

[Claim 2] A help server according to claim 1,
wherein said user needs include at least one of a
20 communication fee and information fee.

[Claim 3] A help server according to claim 1 or
2, characterized by:

notice request means for requesting to notify a
payable fee and a terminal ability to said user
25 terminal apparatus when an inquiry is made from a user
terminal connected via a network;

helper terminal apparatus selection means for

selecting the helper terminal apparatus suitable to respond to the inquiry from said user terminal apparatus; and

session start means for starting a session after
5 connecting the helper terminal apparatus selected by said helper terminal apparatus selection means, and said user terminal apparatus.

[Claim 4] A help server according to any one of claims 1 to 3, characterized by storage means for
10 storing contents of a response of said helper terminal apparatus to the inquiry of said user terminal apparatus, in an answer example database.

[Claim 5] A help server according to claim 4, characterized by:

15 inquiry contents transmission means for transmitting the inquiry contents of said user terminal apparatus to the helper terminal apparatus selected by said helper terminal apparatus selection means; and

helper terminal apparatus information notice means
20 for notifying an information list of helper terminal apparatuses having a will to replay to the inquiry contents transmitted by said inquiry contents transmission means, to said user terminal apparatus.

[Claim 6] A help server according to claim 4 or
25 5, characterized by history list notice means for notifying information list of a similar inquiry history for the inquiry contents transmitted by said inquiry

contents transmission means if the answer example database stores such a similar inquiry history.

[Claim 7] A help server according to any one of claims 4 to 6, characterized by fee notice means for
5 notifying an information fee desired by said helper terminal apparatus at the time of replying from the helper.

[Claim 8] A help server according to any one of claims 4 to 7, characterized by communication ability
10 notice order means for making notify a communication ability of the helper terminal at the time of reply from said helper.

[Claim 9] A help system according to any one of claims 4 to 8, characterized by fee collecting means
15 for taking a fee collection procedure to said user terminal apparatus.

[Claim 10] A help system according to any one of claims 4 to 9, characterized by fee payment means for taking a fee payment procedure to said helper terminal
20 apparatus.

[Claim 11] A help server according to any one of claims 4 to 10, characterized by:

keyword extraction means for extracting keywords from an inquiry when the inquiry is received from said
25 user terminal apparatus;

helper terminal apparatus selection means for selecting at least one of the helper terminal

apparatuses suitable for said inquiry from a plurality of helper terminal apparatuses registered beforehand in accordance with the keywords extracted by said keyword extraction means; and

5 inquiry contents transmission means for transmitting the inquiry of said user terminal apparatus to the helper terminal apparatus selected by said helper terminal apparatus selection means.

 [Claim 12] A help server according to claim 11,
10 characterized by helper terminal apparatus information notice means for notifying a list of information of helper terminal apparatuses which responds so as to answer to the inquiry of said user terminal apparatus, to said user terminal apparatus.

15 [Claim 13] A user terminal apparatus characterized by transmission means for transmitting its own payable fee and terminal ability in accordance with an inquiry of payable fee and terminal ability from a help server.

20 [Claim 14] A user terminal apparatus according to claim 12, characterized by data transmission and receipt means for conducting a session with a helper terminal apparatus via said help server.

 [Claim 15] A help system characterized by the
25 helper terminal apparatus according to any one of claims 1 to 12 and the user terminal apparatus according to claim 13 or 14.

[Claim 16] A control method of the help system,
characterized by:

a notice request step of notifying its own
communication ability to a user terminal apparatus
5 which inquires; and

a communication ability instruction step of
instructing the helper terminal apparatus, which
responds to the inquiry, to respond to the inquiry in a
form suitable for user needs in accordance with the
10 communication ability notified by said user terminal
apparatus.

[Claim 17] A control method of the help system
according to claim 16, wherein said user needs include
at least one of a communication fee and information
15 fee.

[Claim 18] A control method of the help system
according to claim 16 or 17, characterized by:

a notice request notice of requesting to notify a
payable fee and a terminal ability to said user
20 terminal apparatus when an inquiry is made from a user
terminal connected via a network;

a helper terminal apparatus selection step of
selecting the helper terminal apparatus suitable to
respond to the inquiry from said user terminal
25 apparatus; and

a session start step of starting a session after
connecting the helper terminal apparatus selected in

said helper terminal apparatus selection step and said user terminal apparatus.

[Claim 19] A control method of the help system according to any one of claims 16 to 18, characterized
5 by a storage step of storing contents of a response of said helper terminal apparatus to the inquiry of said user terminal apparatus, in an answer example database.

[Claim 20] A control method of the help system according to claim 19, characterized by:

10 an inquiry contents transmission step of transmitting the inquiry contents of said user terminal apparatus to the helper terminal apparatus selected in said helper terminal apparatus selection step; and
a helper terminal apparatus information notice
15 step of notifying an information list of helper terminal apparatuses having a will to replay to the inquiry contents transmitted in said inquiry contents transmission step, to said user terminal apparatus.

[Claim 21] A control method of the help system
20 according to claim 19 or 20, characterized by a history list notice step of notifying information list of a similar inquiry history for the inquiry contents transmitted in said inquiry contents transmission step if the answer example database stores such a similar
25 inquiry history.

[Claim 22] A control method of the help system according to any one of claims 19 to 21, characterized

by a fee notice step of notifying an information fee desired in said helper terminal apparatus at the time of replying from the helper.

[Claim 23] A control method of the help system
5 according to any one of claims 19 to 22, characterized by a communication ability notice order step of making notify a communication ability of the helper terminal at the time of reply from said helper.

[Claim 24] A control method of the help system
10 according to any one of claims 19 to 23, characterized by a fee collecting step of taking a fee collection procedure to said user terminal apparatus.

[Claim 25] A control method of the help system according to any one of claims 19 to 24, characterized
15 by a fee payment step of taking a fee payment procedure to said helper terminal apparatus.

[Claim 26] A control method of the help system according to any one of claims 4 to 10, characterized by:

20 a keyword extraction step of extracting keywords from an inquiry when the inquiry is received from said user terminal apparatus;

a helper terminal apparatus selection step of selecting at least one of the helper terminal
25 apparatuses suitable for said inquiry from a plurality of helper terminal apparatuses registered beforehand in accordance with the keywords extracted in said keyword

extraction step; and

an inquiry contents transmission step of
transmitting the inquiry of said user terminal
apparatus to the helper terminal apparatus selected in
5 said helper terminal apparatus selection step.

[Claim 27] A control method of the help system
according to claim 26, characterized by a helper
terminal apparatus information notice step of notifying
a list of information of helper terminal apparatuses
10 which responded so as to answer to the inquiry of said
user terminal apparatus, to said user terminal
apparatus.

[Claim 28] A computer readable storage medium,
wherein a program to execute said control method of the
15 help system is recorded.

[Detailed Description of the Invention]

[0001]

[Field of the Invention]

The present invention relates to a help server, a
20 helper terminal apparatus, a help system, a control
method of the help system and storage medium. The
present invention particularly relates to the help
system forming an information network, in which a user
asking a question has been registered beforehand, and
25 which connects a user terminal apparatus with a helper
terminal apparatus for providing information to the
user terminal apparatus, and its control method.

[0002]

[Prior Art]

Recent information processing apparatuses such as personal computers and portable information terminals
5 are becoming more compact, lightweight and inexpensive and many persons can have such apparatuses easily. Developments of the Internet are remarkable and any information can be searched easily via the Internet.

[0003]

10 In such a case, a search engine is generally used to search desired information. However, if proper keywords for narrowing down the information to be searched are not set, the search engine extracts only unnecessary information. In addition, it often takes a
15 long time to browse all extracted pages, so that accurate information cannot be obtained at once.

[0004]

Therefore, in order to obtain more accurate information speedily, it can be considered to use
20 information research services, such as help system, to ask a person having expert knowledge. The help system shown here is a system like that, for example, an operator or a helper standing by at an inquiry place replies to an inquiry from a user or prepares an answer
25 and sends it back.

[0005]

Furthermore, nowadays, this help system has been

expanded, so that an automatic help system, in which a user asking a question has been registered beforehand, and which forms an information network connecting to a helper providing information, is also proposed.

5 [0006]

In the overall structure of the automatic help system mentioned above, as shown in Fig. 10, a help server (801'), a plurality of helper terminal apparatuses (802') and a plurality of user terminal
10 apparatuses (803') are interconnected via a network (804') such as the Internet, an intranet, and a public telephone network.

[0007]

This kind of structure eliminates a need where
15 helpers constantly stand by at a place where the help server is installed. For example, it is possible for helpers to directly answer in a home or satellite office at which a helper works or from a portable information terminal apparatus. Therefore, this makes
20 easier to secure helpers essential for operating the help system and makes it possible to provide prompt rely to the user as a result.

[0008]

[Problem to be Solved by the Invention]

25 Technical innovation of information processing apparatuses is now remarkable, and there are various types of information processing apparatuses and various

connection methods to networks. In such circumstances,
there are many communication methods such as a speech
fixed telephone, an Internet telephone, a TV telephone,
a portable telephone, a portable TV telephone, an e-
5 mail, and a bulletin board or chat via the Internet.
[0009]

In the case of the above-mentioned conventional
help system, however, the helper server (801') supports
only a specific communication method for sending back
10 an answer in most of the cases. Therefore, this causes
the following problem: although a plurality of helpers,
who have various communication abilities mentioned
above, are ready to answer, the user has no room for
selection so that the helper is allocated or the answer
15 of the helper is converted to a specific communication
method, and the user therefore cannot select the
communication method freely.
[0010]

Suppose, for example, a user who has a TV
20 telephone portable terminal apparatus makes an inquiry
in a text transmission format to the above-mentioned
help server (801') via the network (804'). The help
server checks the inquiry contents, selects the
appropriate helper terminal apparatus (802'), and
25 transfers the inquiry contents to the helper terminal
apparatus (802').
[0011]

Here, even when this helper had the TV telephone portable terminal apparatus, the same as the user, the above-mentioned help server (801') did not notify such to the user terminal apparatus but only sent answer
5 contents from the helper terminal apparatus (802') to the user via the Internet or using e-mail or the like set by the help system.

[0012]

Some users wish to obtain information only free of
10 cost, whereas some users wish to obtain information even if a high fee is requested. Some helpers wish to widely distribute their knowledge free of cost, whereas some helpers do not make information in public if a fee in compensation for it is not paid.

15 [0013]

As mentioned above, the conventional inquiry made via the help server (801') has a problem that communication abilities of information equipment cannot be utilized fully. Furthermore, the above-mentioned
20 conventional help server (801') has a problem that although a charging system of communication fee, information fee, and the like is changeable in accordance with these various communication abilities and answer contents, the users and helpers cannot
25 select the charging system randomly so that the helper cannot answer efficiently in a short time in a manner suitable for user needs.

[0014]

In consideration of the problems mentioned above,
an object of the present invention is to provide a help
system capable of efficiently sending back an answer to
5 an inquiry from a user terminal apparatus in a short
time in a manner suitable for user needs.

[0015]

[Means for Solving the Problem]

A help server according to the present invention
10 is characterized by notice request means for notifying
its own communication ability to a user terminal
apparatus which inquires, and communication ability
instruction means for instructing the helper terminal
apparatus, which responds to the inquiry, to respond to
15 the inquiry in a form suitable for user needs in
accordance with the communication ability notified by
the user terminal apparatus.

The present invention is also characterized in
that the user needs include at least one of a
20 communication fee and information fee.

The present invention also characterized by notice
request means for requesting to notify a payable fee
and a terminal ability to the user terminal apparatus
when an inquiry is made from a user terminal connected
25 via a network, helper terminal apparatus selection
means for selecting the helper terminal apparatus
suitable to respond to the inquiry from the user

terminal apparatus, and session start means for starting a session after connecting the helper terminal apparatus selected by the helper terminal apparatus selection means, and the user terminal apparatus.

5 The present invention is also characterized by storage means for storing contents of a response of the helper terminal apparatus to the inquiry of the user terminal apparatus, in an answer example database.

 The present invention is also characterized by
10 inquiry contents transmission means for transmitting the inquiry contents of the user terminal apparatus to the helper terminal apparatus selected by the helper terminal apparatus selection means, and helper terminal
 apparatus information notice means for notifying an
15 information list of helper terminal apparatuses having a will to replay to the inquiry contents transmitted by the inquiry contents transmission means, to the user terminal apparatus.

 The present invention is also characterized by
20 history list notice means for notifying information list of a similar inquiry history for the inquiry contents transmitted by the inquiry contents transmission means if the answer example database stores such a similar inquiry history.

25 The present invention is also characterized by fee notice means for notifying an information fee desired by the helper terminal apparatus at the time of

replying from the helper.

The present invention is also characterized by communication ability notice order means for making notify a communication ability of the helper terminal
5 at the time of reply from the helper.

The present invention is also characterized by fee collecting means for taking a fee collection procedure to the user terminal apparatus.

The present invention is also characterized by fee
10 payment means for taking a fee payment procedure to the helper terminal apparatus.

The present invention is also characterized by keyword extraction means for extracting keywords from an inquiry when the inquiry is received from the user
15 terminal apparatus, helper terminal apparatus selection means for selecting at least one of the helper terminal apparatuses suitable for the inquiry from a plurality of helper terminal apparatuses registered beforehand in accordance with the keywords extracted by the keyword
20 extraction means, and inquiry contents transmission means for transmitting the inquiry of the user terminal apparatus to the helper terminal apparatus selected by the helper terminal apparatus selection means.

The present invention is also characterized by
25 helper terminal apparatus information notice means for notifying a list of information of helper terminal apparatuses which responds so as to answer to the

inquiry of the user terminal apparatus, to the user terminal apparatus.

The present invention is also characterized by transmission means for transmitting its own payable fee
5 and terminal ability in accordance with an inquiry of payable fee and terminal ability from a help server.

The present invention is also characterized by data transmission and receipt means for conducting a session with a helper terminal apparatus via the help
10 server.

[0016]

A help system according to the present invention is characterized by the helper terminal apparatus mentioned above and the user terminal apparatus
15 mentioned above.

[0017]

A control method of the help system according to the present invention is characterized by a notice request step of notifying its own communication ability
20 to a user terminal apparatus which inquires, and a communication ability instruction step of instructing the helper terminal apparatus, which responds to the inquiry, to respond to the inquiry in a form suitable for user needs in accordance with the communication
25 ability notified by the user terminal apparatus.

A control method of the help system according to the present invention is characterized in that the user

needs include at least one of a communication fee and information fee.

A control method of the help system according to the present invention is characterized by a notice
5 request notice of requesting to notify a payable fee and a terminal ability to the user terminal apparatus when an inquiry is made from a user terminal connected via a network, a helper terminal apparatus selection
10 step of selecting the helper terminal apparatus suitable to respond to the inquiry from the user terminal apparatus, and a session start step of starting a session after connecting the helper terminal apparatus selected in the helper terminal apparatus selection step and the user terminal apparatus.

15 A control method of the help system according to the present invention is characterized by a storage step of storing contents of a response of the helper terminal apparatus to the inquiry of the user terminal apparatus, in an answer example database.

20 A control method of the help system according to the present invention is characterized by an inquiry contents transmission step of transmitting the inquiry contents of the user terminal apparatus to the helper terminal apparatus selected in the helper terminal
25 apparatus selection step, and a helper terminal apparatus information notice step of notifying an information list of helper terminal apparatuses having

a will to replay to the inquiry contents transmitted in the inquiry contents transmission step, to the user terminal apparatus.

5 A control method of the help system according to the present invention is characterized by a history list notice step of notifying information list of a similar inquiry history for the inquiry contents transmitted in the inquiry contents transmission step if the answer example database stores such a similar
10 inquiry history.

A control method of the help system according to the present invention is characterized by a fee notice step of notifying an information fee desired in the helper terminal apparatus at the time of replying from
15 the helper.

A control method of the help system according to the present invention is characterized by a communication ability notice order step of making notify a communication ability of the helper terminal
20 at the time of reply from the helper.

A control method of the help system according to the present invention is characterized by a fee collecting step of taking a fee collection procedure to the user terminal apparatus.

25 A control method of the help system according to the present invention is characterized by a fee payment step of taking a fee payment procedure to the helper

terminal apparatus.

A control method of the help system according to the present invention is characterized by a keyword extraction step of extracting keywords from an inquiry
5 when the inquiry is received from the user terminal apparatus, a helper terminal apparatus selection step of selecting at least one of the helper terminal apparatuses suitable for the inquiry from a plurality of helper terminal apparatuses registered beforehand in
10 accordance with the keywords extracted in the keyword extraction step, and an inquiry contents transmission step of transmitting the inquiry of the user terminal apparatus to the helper terminal apparatus selected in the helper terminal apparatus selection step.

15 A control method of the help system according to the present invention is characterized by a helper terminal apparatus information notice step of notifying a list of information of helper terminal apparatuses which responded so as to answer to the inquiry of the
20 user terminal apparatus, to the user terminal apparatus.

[0018]

A storage medium according to the present invention is characterized in that a program to execute
25 the above-mentioned control method in a computer is recorded.

[0019]

[Embodiment(s) Of The Invention]

[Embodiment(s)]

Embodiments of a help server, a helper terminal apparatus, help system, a control method of the help system and storage medium of the invention will be described with reference to the accompanying drawings. In the overall structure of a help system of this embodiment, as shown in Fig. 8, a help server (801), a plurality of helper terminal apparatuses (802) and a plurality of user terminal apparatuses (803) are interconnected via a network (804) such as the Internet, an intranet, and a public telephone network. Although only one help server (801) is shown for the purposes of convenience, a plurality of help servers may be used.

[0020]

The installation place of a plurality of the help terminal apparatuses (802) may be, for example, a home or satellite office at which a helper works or portable information terminal apparatus and so on. The user terminal apparatus (803) may be a PC installed in a home, an office computer, a portable information terminal apparatus or the like.

[0021]

Fig. 1 shows an example of the structure of the help server in the help system of this embodiment.

The help server of this embodiment is constituted

of a central processing unit (hereinafter called a CPU) (102), a main storage device (103) for storing a program for controlling the above-mentioned CPU (102), a network interface (104) for connection to a network (105), such as the Internet, an intranet and a public telephone network, a speech interface (106), an external memory (107) for storing an answer example database, an external memory (108) for storing a helper management database, and the like, respectively connected to a system bus (101).

[0022]

The functions stored in the main storage device (103) include, for example, a speech recognition/synthesis function (103a), a keyword search function (103b), a message editing/transmission function (103c), a fee payment/collection function (103d), a session management function (103e), and the like. The above-mentioned CPU (102) is controlled by using these functions.

[0023]

The network interface (104) performs an interface control such as a communication protocol control for a connection to the network (105) such as the Internet, an intranet and a public telephone network. Although one network (105) is shown for the purposes of convenience, it is assumed that the network interface (104) supports a plurality of communication protocols

and protocol conversion functions.

[0024]

As shown in Fig. 9, the network interface (104) has a plurality of protocol interfaces (906 to 909) for connections to networks such as the Internet (902), an
5 ISDN (903), an IMT 2000 network (904) and a PHS network (905). Each protocol interface is connected to the system bus 101 via a data conversion matching unit 910 for converting each data format into a common format
10 for format matching.

[0025]

In Fig. 9, although specific communication protocols for the help system are shown for the purposes of convenience, the embodiment is not limited
15 only thereto.

[0026]

The speech interface (106) recognizes voices of a user input from an Internet telephone, a fixed telephone, a portable telephone, or the like connected
20 via the network interface (104) and converts the voices into digital data, or synthesizes digital data supplied from CPU (102) controlled by the contents of the main storage device (103).

[0027]

25 Although the speech interface (106) and network interface (104) are shown separately in Fig. 1, the speech interface (106) may be included in the network

interface (104).

[0028]

The answer example database (107) stores information such as answers in response to past
5 inquiries of the user terminals, and when necessary the answer example database (107) is referred to by a program controlled by the contents of the main storage device 103.

[0029]

10 As shown in Fig. 2, the helper management database (108) stores, for example, at least keywords (201) which the helper can cover, access information (202) such as telephone numbers and mail addresses for accessing the helper from the help server.

15 [0030]

Next, with reference to the sequence chart shown in Fig. 3, the operation of the help system of the present invention will be described.

First, an inquiry (301), e.g., "Want to know
20 various information on lodging houses in Rome", is sent from the user terminal apparatus (31) to the help server (32). As the inquiry methods, a speech telephone, an e-mail, a message transmission on the Web via the network 804, such as the Internet, an intranet
25 and a public telephone network, and the like may be used.

[0031]

If an inquiry is made through a speech telephone, the speech interface (106 in Fig. 1) of the help server (32) and a program of the speech recognition/synthesis function (103a in Fig. 1) stored in the main storage
5 device recognize user voices and convert the voices into digital data.

[0032]

In making an inquiry from a user, the user may input (pronounce) the keywords of the inquiry contents
10 directly. The user may input (pronounce) a long sentence by using the keyword extraction function (103b in Fig. 1).

[0033]

The help server (32) which receives the inquiry
15 issues an inquiry (302) to the user terminal apparatus (31), for example, as to a payable fee (an approximate maximum fee payable to the information) and abilities of the terminal apparatus (communication abilities of the terminal apparatus such as data transfer speed,
20 information transfer ability and terminal type), and at the same time, extracts keywords from the inquiry contents of the user by using the keyword extraction function (103b in Fig 1), and searches the helper hitting the extracted keywords (303).

25 [0034]

In the above example, the keywords of "Rome" (including "Italy"), "lodging", "lodging house"

(including "travel") and the like are extracted.

[0035]

If the example of the helper management table in Fig. 2, a helper (204) having a helper number HN0003 and hitting the keyword "Italy" and a helper (203) having a helper number HN0002 and hitting the keyword "lodging" are selected.

[0036]

Eventually the payable fee and communication abilities are notified from the user terminal apparatus (304). In the case of a speech telephone, a program of the speech recognition/synthesis function (103a in Fig. 1) stored in the main storage device of the help server (32) and the speech interface (106 in Fig. 1) synthesize digital data into a speech and reproduce it to make an inquiry.

[0037]

The inquiry (or notice) for the payable fee and abilities of the terminal apparatus may be omitted or performed at the same time of inquiry. However, as in this embodiment, the user is made to input the payable fee different from the inquiry so that it has an intention to make the user confirm again the will of the inquiry.

[0038]

For example, it is assumed that the user terminal apparatus notifies the information such as "up to about

500 Yen" as the payable fee and "speech / 384 kbps
unrestricted digital communication / TV telephone
terminal / e-mail" as the abilities of the terminal
apparatus.

5 [0039]

Upon reception of this, the help server (32) forms
an inquiry message to be transmitted to the helper
terminal apparatuses (305) and then transmits the
inquiry message to the applicable helper terminal
10 apparatuses (33 (HN0001), 34 (HN0002) and 35) (306).
[0040]

The message contains the data on the user inquiry
contents, abilities of the user terminal apparatus and
the payable fee, but not disclose information capable
15 of identifying the user terminal apparatus in order to
protect the privacy of the user.
[0041]

The method of transmitting the message may be
group transmission or group mailing, or in the case of
20 wireless terminal apparatuses or the like, the above
message may be contained in the extended data field of
group notice information.
[0042]

In the case of a speech telephone, a program of
25 the speech recognition/synthesis function (103a in Fig.
1) stored in the main storage device of the help server
(32) and the speech interface (106 in Fig. 1)

synthesize digital data into a speech and reproduce it.
[0043]

These methods of transmitting may be designated
for each helper terminal apparatus and registered. In
5 that case, the message is stored as the information of
the helper management table in Fig. 2 (205 in Fig. 2).
[0044]

The help server (32) searches the answer example
database (107), and picks up the answer history if the
10 past inquiry similar to the present inquiry exists
(307). The help server (32), which receives responses
and presentations of desired fees and desired abilities
of the terminal apparatus from the helper terminal
apparatuses (33 and 34) (308), forms a message to be
15 transmitted to the user terminal apparatus by referring
to the contents of the messages and the past answer
examples (309) and transmits a list to the user
terminal apparatus 831) (310).

[0045]

20 The list transmitted here contains, for example,
as shown in Fig. 4, information (401) on the HN0001
helper terminal apparatus (33), information (402) on
the HN0002 helper terminal apparatus (34), and the
answer example database information (403) and the like
25 are listed, but does not disclose any information
capable of identifying the helper in order to protect
the privacy of the helper.

[0046]

In the case of a speech telephone, a program of the speech recognition/synthesis function (103a in Fig. 1) stored in the main storage device of the help server (32) and the speech interface (106 in Fig. 1) synthesize the list into a speech and reproduce it to urge to select a desired helper terminal.

[0047]

When the user terminal apparatus (31) selects the helper terminal apparatus from this list and transmits a request of a session (311), the help server (32) judges whether the helper terminal apparatus selected is a pay information provider.

[0048]

If the helper terminal apparatus is the pay information provider, the help server (32) transmits a fee collection procedure request to the user terminal apparatus (312) to make the user terminal apparatus perform the fee collection procedure (313). For example, when the user selects the information (401) of the HN0001 helper terminal apparatus (33) in Fig.4, since the information fee is 500 Yen, the user terminal apparatus (31) performs the fee collection procedure of 500 Yen (313).

[0049]

Upon reception of this, the help server (32) performs certification of the fee collection of the

user terminal apparatus (314), and notifies the helper terminal apparatus of the session request and fee pay notice (315).

[0050]

- 5 If the helper terminal apparatus (33) returns a session response to the help server (316), the help server transfers the session response (317) to the user terminal apparatus (31) and the session starts (318).

[0051]

- 10 The session here means that data converted to match the communication ability is transferred between the user terminal apparatus (31) and helper terminal apparatus (33) via the help server (32), and the data is not transferred directly between the user terminal
15 apparatus (31) and helper terminal apparatus (33).

Therefore, With the help system of this embodiment, the anonymity of the user and helper can be guaranteed.

[0052]

- If the terminal apparatus communication abilities
20 are different between the user terminal apparatus and the helper terminal apparatus, the network interface (104 in Fig. 1 or Fig. 9) converts the communication protocol (e.g., converts the data of the terminal apparatus having high communication abilities to the
25 protocol of the terminal apparatus having low communication abilities) so as to assure consistency of mutual data.

[0053]

After confirming the normal start of the session, the help server (32) performs the fee collection process for the user and fee payment process for the helper (319). These processes may be performed before or after the session.

[0054]

If the user desires to obtain more information during the session, then the help server may perform an additional fee collection process for the user terminal apparatus and an additional fee payment process for the helper terminal apparatus. At the time of the fee collection and fee payment, a portion of the fee may be paid to the help server as a mediator commission.

15 [0055]

This may be a system where an advertisement fee is collected from an advertiser by transmitting an advertisement banner or message to the user terminal apparatus or helper terminal apparatus before or after or during the session.

[0056]

If there is a helper (e.g., travel agent, etc. in the case of this example) whose object is the business activity, in the helper terminal apparatus group, this may be a system where a registration fee is collected from this helper. The contents of the session are stored in the answer example database (107). If a

similar inquiry is issued thereafter, the answer example is referred to.

[0057]

However, the user terminal apparatus or helper
5 terminal apparatus may reject this before or after the start of the session or after the end of the session. If the session contents are stored in the answer example database (107), an additional fee may be paid to the helper terminal apparatus as an information
10 providing fee.

[0058]

Next, with reference to the flow chart shown in Fig. 5, the operation of the help server of the help system according to the embodiment will be described.
15 A portion of the detailed description is the same as the description of the help system described earlier, so that this portion is omitted.

[0059]

First, suppose an inquiry is sent from a user
20 terminal apparatus to the help server (501). The help server received the inquiry transmits information on the payable fee (e.g., an approximate maximum fee payable to the information) and terminal apparatus abilities (data transfer speed, information transfer
25 ability, terminal apparatus type and communication ability of the terminal apparatus) to the user terminal apparatus (502). At the same time, the help server

extracts keywords from the inquiry contents of the user
and by referring to the helper management table (Fig.
2) searches the helper hitting the extracted keywords
(S503). Eventually, the help server receives the
5 notice of the payable fee and terminal apparatus
abilities from the user terminal apparatus (504).
[0060]

The help server received this forms an inquiry
message to be transmitted to the helper terminals
10 apparatus (505) and then transmits to the applicable
helper terminal apparatuses (506). The created message
does not contain information capable of identifying the
user terminal apparatus in order to protect the privacy
of the user, although the message contains the data on
15 the user inquiry contents, abilities of the user
terminal apparatus and the payable fee.
[0061]

The help server searches the answer example
database and picks up the answer history at that time
20 if there is similar inquiry in the past (507). The
help server receives responses and presentation of
messages of desired fees and desired terminal apparatus
abilities from the helper terminal apparatuses (508).
By referring to the contents of the messages and the
25 past answer examples, the help server forms a message
to transmit to the user terminal apparatus (509) and
transmits a list to the user terminal apparatus (510).

[0062]

The list to be transmitted does not contain information capable of identifying the helper terminal apparatus in order to protect the privacy of the helper. After the user terminal apparatus selects the desired helper terminal apparatus from this list (511), the help server judges whether the helper terminal apparatus selected is a pay information provider (512).

[0063]

If the helper terminal apparatus is the pay information provider, the help server transmits a fee collection procedure request to the user terminal apparatus (513) to make the user terminal apparatus perform the fee collection procedure (514). Upon reception of this, the help server performs certification of the fee collection of the user terminal apparatus (515) and notifies the helper terminal apparatus of the session request and fee pay notice (516).

[0064]

At this time, if the helper terminal apparatus returns the session response (517) to the user terminal apparatus, the session response is transferred to the user terminal apparatus (518), and the help server starts the session (520). The session hear means that data converted to match the communication ability is transferred between the user terminal apparatus and

helper terminal apparatus via the help server, and the data is not transferred directly between the user terminal apparatus and helper terminal apparatus.

[0065]

5 Therefore, the anonymity of the user and helper can be guaranteed. After the help server confirms the normal start of the session, the help server performs the fee collection process of the user and the fee payment process for the helper (519). These processes
10 may be performed before the start of the session or after the end of the session.

[0066]

Next, with reference to the flow chart shown in Fig. 6, the operation of the user terminal apparatus of
15 the help system according to the embodiment will be described. The user terminal apparatus according to the embodiment may be a PC installed in a home, an office computer, a portable information terminal apparatus or the like.

20 [0067]

A portion of the detailed description is the same as the description of the help system described earlier, so that this portion is omitted. First, a user enters an inquiry from the user terminal apparatus
25 to the help server (601) and sends it (602). As the inquiry methods, a speech telephone, an e-mail, a message transmission on the Web via the network, such

as the Internet, intranet, and a public telephone network and the like may be used.

[0068]

When the user terminal apparatus receives an
5 inquiry as to a payable fee (e.g., an approximate
maximum fee payable to the information) and abilities
of the terminal apparatus (communication abilities of
the terminal apparatus such as data transfer speed,
information transfer ability, terminal type and the
10 like) from the help server received this (603), the
user enters a desired fee for the inquiry and the like
in accordance with the inquiry (604) and transmits them
(605). For a communication ability, the user terminal
apparatus may notify the help server of ability of its
15 own terminal apparatus automatically or the user may be
set it manually.

[0069]

Eventually the user terminal apparatus receives
the list of information on helper terminal apparatuses
20 and information on the answer example database from the
help server (606). The user selects the desired helper
terminal apparatus from this list (607) and transmits a
session request (608).

[0070]

25 The help server judges whether the helper selected
is a pay information provider (609). If the helper
selected is a pay information provider, a fee

collection procedure request is transmitted from the help server (610), and the user performs the fee collection procedure (611). After the user terminal apparatus receives a session response (612), the
5 session starts (521).

[0071]

Lastly, with reference to the flow chart shown in Fig. 7, the operation of the helper terminal apparatus of the help system according to the embodiment will be
10 described. The installation place of the help terminal apparatus may be, for example, a home or satellite office at which a helper works or portable information terminal apparatus and so on. A portion of the detailed description is the same as the description of
15 the help system described earlier, so that this portion is omitted.

[0072]

First, an inquiry message is transmitted from the help server (701). The inquiry message does not
20 disclose information capable of identifying the user in order to protect the privacy of the user, although the inquiry message contains the information on the user inquiry contents, abilities of the user terminal apparatus and the payable fee.

25 [0073]

The method of transmitting the message may be group reception or group mailing, or in the case of

wireless terminal apparatuses or the like, the above message may be contained in the extended data field of group notice information. These methods of sending the message may be designated and registered beforehand for
5 each helper terminal apparatus, and in that case stored as the information of the helper management table in Fig. 2 (205 in Fig. 2)

[0074]

If the helper believes that he can answer the
10 inquiry received, the helper enters a response message, desired fee and the like (702) and transmits them (703). Abilities of the helper terminal apparatus are transmitted to the help server after the helper terminal apparatus notifies abilities of its own
15 terminal apparatus automatically or the helper manually sets (703).

[0075]

After that, the operation is branched into two types (700) and the helper selected by the user
20 receives from the help server the session request and fee payment notice (704). The helper not selected by the user receives an inquiry completion notice from the help server (705). This reception of the inquiry completion notice may be omitted.

25 [0076]

Upon reception of the session request and the fee payment notice (704), the helper confirms the fee

information and the like, and thereafter enters a session response (706) to transmit (707) and enters into the session status (708).

[0077]

5 Although the embodiment describes specific examples for the purposes of convenience, the invention is not limited only to the above-described embodiment. For example, a desired information processing apparatus may be used as the user terminal apparatus or helper
10 terminal apparatus, and a desired communication method may be used as the communication method for network connection.

[0078]

(Other Embodiments of the Invention)

15 The invention is also applicable to a system having a plurality of apparatuses (e.g., a host computer, an interface apparatus, a reader, a printer and the like) or to a single apparatus.

[0079]

20 The scope of the invention contains also the case wherein software program codes realizing the function of each embodiment described above are supplied to a computer (CPU or MPU) of the apparatus or system connected to various devices realizing the embodiment
25 function, and the computer operates the devices in accordance with the stored programs.

[0080]

In this case, the software program codes themselves realize the embodiment function. Therefore, the program codes themselves and means for supplying the program codes, e.g., a storage medium storing the program codes, constitute the present invention. The storage medium for storing such program codes may be a floppy disk, a hard disk, an optical disk, a magneto optical disk, a CD-ROM, a magnetic tape, a nonvolatile memory card, a ROM or the like.

10 [0081]

It is obvious that the program codes are included in the embodiment of the invention, wherein not only the computer executes the supplied program codes to realize the embodiment function but also the program codes in cooperation with an OS (operating system) running on the computer or with another application or the like realize the embodiment function.

[0082]

It is obvious that the scope of the invention also contains the case wherein the functions of each embodiment can be realized by writing the program codes into a memory of a function expansion board inserted into a computer or of a function expansion unit connected to the computer, and thereafter by executing a portion or the whole of actual processes by a CPU of the function expansion board or function expansion unit.

[0083]

[Effect of the Invention]

As being described so far, the present invention can provide a help system which can send back a
5 response to an inquiry from a user terminal apparatus in a short time, efficiently, and a format satisfying user needs.

Especially, a help system according to the present invention provides an effect that if a plurality of
10 helpers having various communication abilities are ready to answer, the user can select the helper freely and, therefore, communication abilities of information apparatuses can be fully utilized.

Furthermore, in the help system of the present
15 invention, charging systems of communication fee, information fee, and the like can be varied in accordance with these various communication abilities and response contents, and the users and helpers can set or select the charging systems freely. This makes
20 it possible to enhance service performance, increase the number of registered helpers and users, and then increase profitability of the help system.

[Name of the Document] Abstract

[Abstract]

[Problem(s)] It can provide a help system which can
send back a response to an inquiry from a user terminal
5 apparatus in a short time, efficiently, and a format
satisfying user needs.

[Means for Solving the Problem(s)] A help server
comprises notice request means for notifying its own
communication ability to a user terminal apparatus
10 which inquires, and communication ability instruction
means for instructing the helper terminal apparatus,
which responds to the inquiry, to respond to the
inquiry in a form suitable for user needs in accordance
with the communication ability notified by the user
15 terminal apparatus, thereby being able to select
charging systems of communication fee, information fee,
and the like in accordance with various communication
abilities and reply contents.
